                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -i- PTM: Contains a constantly attached chromophore, which is composed of modified amino acid residues. The chromophore is formed upon cyclization of the residues Ser-dehydroTyr-GH.

-i- BIOTECHNOLOGY: Has become a useful and ubiquitous tool for making chimeric proteins of GFP linked to other proteins where it functions as a fluorescent protein tags GFP colerates N-and C-terminal fusion to a broad variety of proteins. It has been expressed in bacteria, yeast, slime mold, plants, Drosophila, zebrafish, and in mammalian cells. As a noninvasive fluorescent marker in living cells, it allows for a wide range of applications where it may function as a cell lineage tracer, reporter of gene expression, or as a measure of protein-protein interactions.

NOTE_ISSUE (1) of June 2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. -!- CACKALYTIC ACTIVITY: ATP + L-leucine + tRNA(Leu) = AMP +
diphosphate + L-leucyl-tRNA(Leu).
-!- SUBJCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10-6CT-2003 (Rel. 42, Created)

"Molecular cloning and nucleotide sequence of a gene for alkaline cellulase from Bacillus sp. KSM-635.";
J. Gen. Microbiol. 136:137-1337-1334(1990).
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-beta-D-glucosidic linkages in cellulose, lichenin and cereal beta-D-glucosid:
-!- SIMILARITY: Belongs to cellulase family A (family 5 of glycosyl hydrolases).
-!- SIMILARITY: Contains 3 S-layer homology (SLH) domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-NOV-1990 (Rel. 16, Created)

Submitted (JUL-2002) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- CAUTION: Ref.1 (CAB81884) sequence differs from that shown due to erroneous gene model prediction.
-!- CAUTION: Ref.3 sequence differs from that shown due to a frameshift in position 250 and numerous sequencing errors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nagase T., Nakayama M., Nakajima D., Kikuno R., Ohara O.;
"Prediction of the coding sequences of unidentified human genes. XX. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro.";
DNA Res. 8:85-95(2001).
-!-FUNCTION: Converts acetate to acetyl-CoA so that it can be used for oxidation through the tricarboxylic cycle to produce ATP and CO(2) (By similarity).
-!-CATALYTIC ACTIVITY: ATP + acetate + CoA = AMP + diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        52; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    acetyl-Coa.

Bacteriol. 185:1018-1026(2003).
-!- CATALYTIC ACTIVITY: ATP + L-leucine + tRNA(Leu) = AMP +
diphosphate + L-leucyl-tRNA(Leu).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             10-OCT-2003 (Rel. 42, Last sequence update)

SISSIMILARITY.

135 BY SIMILARITY.

" 1; Length 357;
                                                reveals hypervariable sequences.";

Nature 403:65-668(2000).
-!- FUNCTION: Catalyzes the formation of 5-methyl-uridine at position 54 (M-5-U54) in all tRNA (By similarity).
-!- CATALYTY: S-adenosyl-Lumethionine + tRNA = S-adenosyl-Lumethionine + tRNA = S-adenosyl-Lumocysteine + tRNA containing thymine.
-!- SIMILARITY: Belongs to the RNA M5U methyltransferase family. TrmA

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Novel fluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G mutation.

Claim 9; Page 37; 41pp; English.

```
The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations fluorescent protein (GFP) or its analogue. The GFP containing mutations can reful and E323C has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in studying protein redistribution. The fluorescent protein is useful in studying collular functions in living cells, separable tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker for changes in cell morphology, as transfection marker. The fluorescent protein is also useful as a cell or organelle integrity marker to be used in combination with fluorescence activated cell sorting (FACS). The novel proteins can also be used as reporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein as markers in transcriptional and translational transposons encoding the fluorescent protein are for bacterial detection. Transposons encoding the fluorescent protein are constant for screening promoters and for tagging plasmids and chromosomes. The fluorescent protein engineered into the genome of a phage is useful for designing diagnostic tool. The present sequence is a DNA encoding channed F6AL-E22CG jellyfish green fluorescent protein (GFP) mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

```
The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HC1) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated to an interactor protein (IP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful for screening compounds that modulate the interaction between two intracellular proteins. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel cell for identifying modulators of protein interaction, contains a first conjugate comprising anchor protein, second conjugate having type B interactor protein and third conjugate with detectable group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDB4 spots, which may optionally be induced by a Rolipram-like reference compound, and testing if inhibits the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for identifying compounds useful for the treatment of diseases of the central nervous system such as joint inflammation, Crohn's diseases of inflammatory disease, respiratory diseases, chronic obstructive pulmonary disease (COPD), including asthma, chronic bronchitis, pulmonary emphysema, postiabis, bone resorption diseases, repertusion injury, cancer and HIV infection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDB for the preparation of a medicament. The present distribution of the PDB for the preparation of a HSPDE4A1-E22G fusion
                                                                                                          Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MVSKGEBLFTGVVPILVBLDGDVNGHKFSVSGBGBGDATYGKLTLKFICTTGKLPVDWPT 60

The invention relates to determining, if a compound, is a dislocator of PDB4. The method comprises testing if the compound removes PDB4 spots, which may optionally be induced by a Nollpram-like reference compound, and testing if it inhibits the catalytic activity of the PDB4, where the compound is a dislocator of PDB4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for compound is a dislocator of PDB4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDB4. The method is useful for disease such as joint inflammation, Crohn's disease, inflammatory bowel disease, respiratory diseases, chronic obstructive pulmonary disease. (COPD), including asthma, chronic obstructive pulmonary disease. COPD), including asthma, chronic bronchitis, pulmonary emphysema, psoriasis, bone resorption diseases, reperfusion injury, cancer and HIV confection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDE for the capparation of a medicament. The present sequence represents the amino acid sequence of a HSPDE4A4-E222G fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        954 LVTILSYGVOCFSRYPDHMKQHDFFKSAMPEGYVQERIIFFKDDGNYKTRAEVKFEGDIL 1013

screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biodetector functions. The methods of the invention utilise fluorescent biodetector molecules which, when acted on by a compound of interest, cause an alteration in the cellular distribution of at least the fluorescent conjecty. In one embodiment, the biosensors comprise heat shock proteins (HSPS) fused to a fluorescent protein (e.g., jellyfish green fluorescent the cytoplasm, but on stress activation translocate to the nucleus. In the cytoplasm, but on stress activation translocate to the nucleus. In another embodiment biodetector proteins can be used to detect protease cativity. Such protease biodetector fusion proteins comprise one or more cativity. Such protease biodetector fusion proteins comprise one or more cativity. Such protease biodetector fusion proteins comprise one or more components may be components of a single protein which is cleaved by the protease, or may be from heterologous sources. Due to the components may be from heterologous sources. Due to the components may be from heterologous sources. Due to the components of a single protein is localised to a particular cregion of the cell. Once acted on by the protease of interest, the fluorescent protein is cleaved from the localisation sequence, and is second localisation signal attached from the localisation sequence. The fluorescent protein to be directed to a different cellular compartment after cleaved of the protease recognition sequence. The magning methods with a high degree of spatial resolution. The methods and imaging methods with a high degree of spatial resolution. The methods and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a fluorescent protein derived from green
fluorescent protein (GFP) or its analogue. The GFP containing mutations
at F64L and E225G has a bigger compared to other GFP's making it very
suitable for high throughput screening due to better resolution. The
fluorescent protein is useful in invitro assays for measuring protein
kinase activity or dephosphorylation activity, or for measuring protein
containing in living cells as protein ts useful in studying cellular
functions in living cells as protein tags in transgenic animals, living
and fixed cells, organelle tags, secretion marker and genetic reporter.
Che fluorescent protein is also useful as a cell or organelle integrity
marker, a marker to be used in combination with fluorescence activated
call sorting (FACS). The novel proteins can also be used as reporters to
connict live or dead blomass of organisms, such as fungi. The fluorescent
protein is also useful as markers in transcriptional and translational
fusions for performing transposon vector mutagenesis and as a reporter
con because in detection. Transposons encoding the fluorescent protein are
cuseful for screening prometers and for tagging plasmids and chromosomes.
The fluorescent protein engineered into the genome of a phage is useful
is allowed an invited the present sequence is enhanced F64L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

cellular activities and to screen compounds which modulate these activities. Biosensors containing a recognition site for caspase, for example, may be used for the screening of compounds which modulate apoptosis, while biosensors containing other protease recognition sites may be used for the detection of proteolytic toxins (such as anthrax lethal factor). The method provides improved target validation and candidate compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature extraction, data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug candidates. Sequences AAB22881-B22885 represent fluorescent proteins which may used as components of biosensor fusion proteins of the invention

The present sequence represents a functional engineered fluorescent protein based on the Aequorea green fluorescent protein (GFP). The emission intensity changes as pH varies between 5 and 10 of the present protein are novel. The functional engineered fluorescent proteins show reversible changes in fluorescence over physiological pH ranges. They can be used for determining the pH of samples and cells. The polynucleotides can also be used to produce transgenic animals. The fluorescent protein pH sensors can be delivered to cells in the form of polynucleotides encoding the protein sensor fused to a targeting signal. The targeting signal directs the expression of the protein sensors to restricted cell locations. This makes it possible to measure the pH of a precisely defined cellular region or organelle

The present sequence is that of the EGFP signal domain, which can be included in novel recombinant protease biosensors (PBS) of the invention. The PBS (see AAY79538-54) comprise: a first domain (see AAY79579-87) comprising at least 1 detectable polypeptide signal such as the present sequence; a second domain (see AAY79588-622) comprising at least 1 comprising at least 1 least and a third domain (see AAY79531) comprising at least 1 reactant target sequence. A recombinant nucleic comprising at least 1 reactant target sequence. A recombinant nucleic acid (see AAA27627-43) encoding the PB, an expression vector, and a contacting a host cell are also claimed. A claimed method for identifying compounds that modify protease activity in a cell involves contacting a host cell that possesses the recombinant PB with a test compound, and determining the PB distribution in the host cell, where compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds coll, or the recombinant PB, or the vector, or the vector, or the vector, or the vector, or the vector, or the vector, or the vector, or the vector or the vector, or the vector or the vector or the vector. The present sequence is a fluorescnet protein used in the construction of a fluorescent protein indicator. The indicator comprises a sensor polypeptide that is responsive to a chemical, biological, electrical or physiological parameter, and a fluorescence protein functional group. The sensor polypeptide is operatively inserted into the fluorescent moiety. The fluorescent indicator is useful for detecting the presence of a response inducing member in a sample. The method involves contacting the sample with the indicator and detecting a change in fluorescence, in which a change is indicative of the effect of the parameter on the sensor polypeptide. The novel fluorescent proteins are advantageous due to their reduced size as compared to the FRET (fluorescence resonance energy transfer)-based sensors

Novel fluorescent proteins comprising a sensor protein inserted into them, useful for measuring the response of a sensor biological, chemical, electrical or physiological parameter in vivo or in vitro.

The specification describes a method for assessing the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The method comprises introducing at least two reporter genes encoding luminescent and/or fluorescent products into the micro-organisms, incubating the micro-organism within the desired environment, and detecting luminescence and/or fluorescence after a predetermined time period. Use of two different markers within a micro-organism enables the differentiation between growth and death rates. The method is used to assess the growth rate and death rate of a micro-organism within a predetermined time period in a desired environment. The present sequence represents a green fluorescent protein (GFP), and is encoded by a plasmid which encodes luminescent and fluorescent proteins, and is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides melanin concentrating hormone (MCH) receptor (MCHR) chimeric and fusion proteins. The MCHR chimeric proteins comprise MCHR polypeptide regions from different species. The MCHR fusion protein comprise MCHR polypeptide region and a fluorescent polypeptide region protein joined directly, or via a linker, to the carboxy side of the MCHR polypeptide region. The MCHR fusion proteins can be expressed by standard recombinant methodology. MCH action promotes feeding (orexigenic) and up regulation of MCH activity stimulates food intake. The present sequence represents a A. victoria green fluorescent protein (GFP) and a linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                                                                                                                                                                                                                      The invention relates to a gene encoding proteins having cyan-green fluorescence characteristic and having a function of showing stable fluorescence characteristic in acid region. A method for the preparation of a cyan-green fluorescent protein is provided which involves a transformed by a recombinant vector comprising the gene, where the transforment is cultured and the protein is collected from the culture. The present sequence represents the A. victoria green fluorescent protein (EGFP)

The invention describes methods of automated detection, classification and identification comprising treating cells containing luminescent reporter molecules (I) in array of locations with a test substance, where (I) are detectors, classifiers or identifiers, imaging cells in each contain to obtain luminescent signals and converting optical information location to obtain luminescent signals and converting optical information into digital data to interpret presence of toxins into the test substance. The method are useful for detection of toxins chosen from proteases, ADP-cribosylating toxins, cytotoxic phospholipases, and exfoliative toxins. Three classes of cell-based luminescent reporter molecules such as detectors, classifiers and identifiers are described and serve as choracterisation ensure a rapid readout of toxin class without characterisation ensure a rapid readout of toxin class without several complex mixtures of known toxins. This is the amino acid sequence several complex mixtures of known toxins. This is the amino acid sequence of a protease biosensor related signal sequence used in the cell-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

comprising a phosphorylation polypeptide and a fluorescent procein or in poperative linkage, a donor molecule, a phosphorylatable domain, a phosphominoacid binding domain (PAABD) and an acceptor molecule. The phosphorylation indicators of the invention are useful for detecting kinases or phosphatases in a biological sample. They are also useful in high throughput analysis e.g. for detecting a kinase inhibitor. The present sequence is Aequorea victoria enhanced green fluorescent protein (EGPP) used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 LVTTLTYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

Sequence 46, Application US/09513783A

Patent No. 641659

GENERAL INFORMATION:
APPLICANT: Giuliano, Kenneth A.
TITLE OF INVENTION: A System for Cell Based Screening
TITLE OF INVENTION: A System for Cell Based Screening
CURRENT APPLICANION NUMBER: US/09/513,783A

CURRENT FILING DATE: 2000-02-25

NUMBER OF SEQ ID NOS: 180

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 46
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; GENERAL INFORMATION:

Patent No. 6130313
GENERAL INFORMATION:
APPLICANT: Kain, Steve
APPLICANT: Li, Xiangiang
TITLE OF INVENTION: Rapidly Degrading GFP-Fusion Proteins and Methods
TITLE OF INVENTION: of Use
FILE REFERENCE: D6100
CURRENT APPLICATION NUMBER: US/09/062,102
CURRENT APPLICATION NUMBER: US 60/060,855
EARLIER PILING DATE: 1997-10-02
NUMBER OF SEQ ID NOS: 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      OTHER INFORMATION: Sequence of the EGFP-MODC422-461 fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

Sequence 6, Application US/09085305

Sequence 6, Application US/09085305

Patent No. 6191269

GENERAL INFORMATION:

APPLICANT: Pollock, Allan

APPLICANT: Turck, Johanna

TITLE OF INVENTION: Selective Induction of Apoptosis in

TITLE OF INVENTION: Malignant Cancer Cells by Delivery of N-Terminal

TITLE OF INVENTION: Interleukin-1-Alpha Pro-Piece Polypeptide

NUMBER OF SEQUENCES: 30

CORRESPONDENCE ADDRESS:

ADDRESSEE: Bozicevic & Reed, LLP

STREET: 285 Hamilton Ave, Suite 200

CITY: Palo Alto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
